7. Ideas For Possible Future Improvements

OVERVIEW

- 0.1. Audience. The intended audience for this document is a researcher with some programming experience.
- 0.2. **Description.** The **Recognition Memory Experiment Framework** is an online utility for parametric generation of **Recognition Memory experiments** to support researchers at the University of Victoria. The software is intended to be web based, self-contained yet comprehensive, and reasonably flexible.

The software is a foundation upon which to develop and deploy interactive surveys/questionnaires as an essential component of Recognition Memory experiment methodologies, and is comprised of two aspects:

- (1) The **researcher facing** portion, which is a simplified API-style programming interface, specifies the sequencing of both:
 - online interactive visual elements, and
 - requests to the participant for response.
- (2) The **participant facing** portion consists of
 - an experimental survey (based on JavaScript/HTML5) which runs client-side in the participant's web browser, and is specified by the researcher in terms of:
 - the different stimuli or other interactive visual elements revealed to the participant, and
 - the possible responses/feedback requested of the partcipant, and
 - a server-side program (written in Python) running on the web server administrated by the researcher, that receives user responses, timing, and other information sent back to the researcher by the JavaScript/HTML5 program.
- 0.3. Requirements for using the software.
- $0.3.1.\ Server-side.$
 - Host:
 - An ordinary web server with Python/CGI enabled, is required.
 - Note: the system was tested with server: Apache/2.2.23 (Unix).
- 0.3.2. Client-side.
 - For experiment participants:
 - A modern web browser (Firefox, Google Chrome, or Safari) on a desktop computer is required.
 - * The system was tested with Chrome v. 57, Safari 10.1, and Firefox 53.0 (64 bit).
 - For researchers and experiment administrators:
 - A text editor is required to edit experiment script files.
 - Limited technical knowledge about JavaScript is required to edit or modify experiments.
 - An FTP program is required for uploading experiment scripts (and downloading response data).
 - * A free/open implementation is FileZilla, available at https://filezilla-project.org/

4

1. The System

- 1.1. **Installation.** The system may be installed on a web server by downloading:
 - https://github.com/ashlinrichardson/m3m0ry/archive/master.zip

and extracting the ZIP file to an administrator-determined folder/location on the server. It's important to check the permissions on the files (please see section 2.1). Note: the University of Victoria Unix web server does not require .htaccess files. If using the software on another server, an .htaccess file may be required. A typical .htaccess file may contain the following:

```
 \begin{aligned} & \text{Options} \ + \text{ExecCGI} \\ & \text{AddHandler cgi-script .py} \end{aligned}
```

and is usually placed in the same folder as the python files that should be run (in this case the only Python file is **xml receive.py**).

1.1.1. install.sh. An automatic script (install.sh) used to download, extract, and set permissions:

```
rm -f master.zip
wget https://github.com/ashlinrichardson/m3m0ry/archive/master.zip
unzip -o master.zip
mv m3m0ry-master/ memory/
chmod -R 755 memory/
chmod -R 754 memory/data/
```

This six line script above was tested on the UVic Unix server: it resulted in the examples being accessible at the following locations:

Instructions

```
http://web.uvic.ca/~lindlab/memory/experiments/instructions/memory.html
```

Delay activity

```
http://web.uvic.ca/~lindlab/memory/experiments/delay/memory.html
```

Feedback activity

```
http://web.uvic.ca/~lindlab/memory/experiments/feedback/memory.html
```

Study activity

```
http://web.uvic.ca/~lindlab/memory/experiments/study-phase/memory.html
```

Test activity

```
http://web.uvic.ca/~lindlab/memory/experiments/test-phase/memory.html
```

More substantial experiment

```
http://web.uvic.ca/~lindlab/memory/experiments/my-experiment/memory.html
```

1.2. **Project Structure.** The system has the following directory structure as in Fig. (1.1).

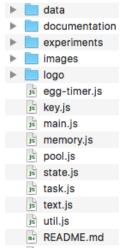

FIGURE 1.1. sml-receive.py

In Fig. (1.1) above:

- data/ should, once survey(s) have been successfully completed, contain CSV data files representing the user experience:
 - If all goes well, an additional data file should automagically appear in the data/ folder, for any given survey/experiment that is successfully completed.
 - Upon completion of a survey/experiment, the client-side JavaScript code submits (via util.js::xml_send()) a CSV data file to the web server, which receives the data using CGI/Python (via xml-receive.py).
 - The CSV file is saved with a name reflecting the date/time when the file was recorded, and also a randomly-generated string that is added to prevent file-naming "collisions".
- documentation/ is where this manual resides.
- experiments/
 - Contains a number of sub-folders, one for each of the included examples:
 - * instructions/
 - * delay/
 - * feedback/
 - * study-phase/
 - * test-phase/
 - * my-experiment/
 - Each of the above subfolder contains a file **memory.html**, which always has the contents:

	6 lines (5 sloc) 70 Bytes	
	1 <html></html>	
	2 <body></body>	
	<pre>3 <script src="//memory.js"><</pre></th><th>/script></th></tr><tr><th></th><th>4 </body></th><th></th></tr><tr><td>FIGURE 1.2.</td><td>5 </html></td><td></td></tr></tbody></table></script></pre>	

Note: any experiment/survey project developed by the user must also:

- * reside in the **experiments**/ folder (as with the examples provided), and:
- * include a **memory.html** file, which should be the same as in Fig. (1.2).
- images/ contains image data used in experiments. To change image data used in experiments, the administrator should:
 - upload new image data into the **images**/ folder, ensuring that the image data is consistently named according to the same numbered format followed by the provided image data: **1.jpg**, **2.jpg**, and so on.

2. **Setup**

2.1. File Permissions on Server. Unix file permissions on the server side should all be set to 755, with the exception of the data folder for which the permissions should be set to 754, to protect submitted data from global visibility.

Unix file permissions may be set recursively using an FTP program such as FileZilla.

N.b., also want to set the permissions on the **experiments**/ folder to 754, to prevent any given survey being accessed by someone who was not given the exact path to the specific survey.

- 2.2. Accessing an Existing Survey. Supposing the project is uploaded to the main HTTP directory of a web server with URL http://my-web-server.com/, the survey in the folder experiments/my-experiment/ as represented by the JavaScript file experiments/my-experiment/my-experiment.js administered by the researcher/administrator, will be accessed by navigating in a web broswer to the following address:
 - http://my-web-server.com/experiments/my-experiment/memory.html

Of course, for any given experiment, a researcher/administrator is advised to thoroughly test the survey, in a web browser, by accessing a URL like the one above.

- 2.3. Creating A New Survey or Modifying An Existing One. To create your own experiment we recommend, with respect to the experiments/ folder on the local computer (which will later be uploaded to the web server e.g., via FTP):
 - (1) making a copy (with a different name) of
 - the folder corresponding to the given example provided which is
 - most closely representative of the experiment which one would like to create.
 - * For example, if we wanted to make simple modifications to the instructions-type example, we could make a copy of the **experiments/instructions/** folder, and rename that folder **experiment/test-experiment/**
 - * If we wanted to develop a more detailed and realistic complete experiment, we might make a copy of the experiment folder **experiment/my-experiment/**, and rename the copied folder to e.g.: **experiment/test-experiment/**
 - (2) given the folder we created, e.g., **experiment/test-experiment/**, we should
 - edit the file **my-experiment.js** within the **my-experiment**/ folder, for example:
 - we could change the messages on any instructions slides;
 - adjust timing parameters (e.g. ISI: Inter-Stimulus-Interval) for certain components;
 - add additional word/image stimuli to an experiment (study/test phase components) with respect to one or more "stimulus pools";

- add further tasks to the experiment (more study/test phases, instructions, delay activities, or extra feedback questions).
- (3) To deploy such an experiment on the web, please make sure to upload your revised folder on the local computer (e.g., experiment/test-experiment/) to the web server.
 - Please ensure that the revised folder is uploaded in the correct location (i.e., within the **experiment**/ relative to the main project folder, as it appears on the web server), and that the revised folder includes both a **my-experiment.js** file and a **memory.html** file.

3. The Examples

Five example surveys are included:

- (1) instructions/: involving display of instructions text or other directions/information;
- (2) **delay**: involving presenting the user with free-form or other response fields, to occupy the participant between different experiment/survey components;
- (3) **feedback**/: involving presenting the user with various (multiple-choice) opportunities to reply with feedback/information;
- (4) **study-phase**/: involving presenting the user with a variety of stimuli (usually accompanied by instructions that indicate to try to remember the stimuli presented);
- (5) **test-phase**/: involving requesting feedback from the user, with respect to a sequence of stimuli information;
- (6) my-experiment/: a more-detailed example, representing a typical possible experiment.

3.1. **experiments/instructions/my-experiment.js.** The file my-experiment.js below exemplifies the required format of a **my-experiment.js** file, which must contain a function called my_experiment, as indicated in line 2:

```
var my experiment = function(){
```

Please note the closing bracket for that function, on line 29. For those not familiar with JavaScript code, the text which appears within the marks: /**/ is a "comment", e.g., /* this is a comment: text within a program that does not represent instructions to be executed */

3.1.1. Instructions Statements. Note that, e.g. in line 5:

instructions ('welcome to the recognition memory experiment framework \n\n\n\t* please press any key to continue')

this indicates presenting the text within the single quotation-marks, to the user. Note: "/n" and "/t" represent "control characters" which affect the flow of text on the screen: "/n" is the newline-character which causes the rendering of text to proceed on the next available line, and "\t" is the tab-character, which indents text several spaces. The researcher can insert as many such statements as they like. Note some possible modifications to the "vanilla" instructions statement above, as follows:

3.1.2. *Instructions: Fixed Duration.* For displaying instructions for a fixed interval (in milliSeconds) we can insert a code block as follows, as in lines 17-19:

```
var x = instructions ('this information will be displayed for 5 seconds') x.set\_expiry(5000) x.key expiry = false
```

3.1.3. *Instructions: Fixed Duration or User Intervention.* For instructions that are shown until a key is pressed, but are shown for (at most) a given fixed interval (in milliSeconds) we can insert a code block as follows, as in lines 22-24:

```
var x = instructions('this information will be displayed for 5 seconds')
x.set_expiry(5000)
x.key expiry = true
```

3.1.4. The file my-experiment.js.

```
1 /* recognition memory experiment set-up */
2 var my experiment = function(){
3
    /* instruction slide */
4
    instructions ('welcome to the recognition memory experiment framework \n\n\n\t* please press any key to
5
         continue')
6
    /* instruction slide */
7
    instructions ('here is what happens when you put in a lot of text - if you put in lots of text, it
8
        might wrap around the edge\n\n\n\t please press any key to continue')
9
    /* instruction slide */
10
    instructions ('this is an instructions slide\n\n\t* please press any key to continue')
11
12
    /* instruction slide */
13
    instructions ('this is an instructions slide with extra line breaks:\nsingle line break:\ndouble line
14
        break:\n\ntriple line break:\n\n\n\t* please press any key to continue')
15
    /* instruction slide -- fixed duration */
16
    var x = instructions('this instructions slide will display for 5 seconds: \n\n\t* if you press a key
17
        , it will do nothing')
    x.set expiry(5000)
18
    x.key\_expiry = false
19
20
    /* instruction slide -- fixed duration or user intervention */
^{21}
    22
         a key, the transition will happen before 5 seconds is up')
    y.set expiry(5000)
23
^{24}
    y.key_expiry = true
```

- 3.2. **experiments/delay/my-experiment.js.** Although other manifestations could be possible for the delay task, the current implementation involves a free-form reponse section to involve the participant in an activity other than observing stimuli (an interval-type activity to be deployed between other experimental components, e.g., between a study-phase component and the subsequent test-phase component).
- 3.2.1. Delay Task. The basic syntax for specifying a "delay" task is like that for the "instructions" task:

delay('please enter the names of as many countries as you can think of, followed by the escape $key n n t^*$ please press any key to continue')

By default, the delay task will continue collecting user input, until the <escape> key is pressed.

3.2.2. Delay Task: Fixed Interval. It's also possible to specify a "delay" task that doesn't wait for an <escape> key to be pressed: this version waits for a specified interval (in mS) instead. To operate the delay with a fixed interval, simply add a time parameter (in mS) to the invocation:

delay('please enter the names of as many countries as you can think of, in 5 seconds $n \ n \ t^*$ please press any key to continue', 5000)

where 5000 mS is five seconds.

3.2.3. The file my-experiment.js.

```
/* recognition memory experiment set-up */
  var my experiment = function(){
3
    instructions ('first delay phase coming up (please press any key to continue)')
4
5
6
    delay task('please write out anything that comes to mind (please press <esc> key when finished)')
7
    /* instruction slide */
8
9
    instructions ('second delay phase (5 seconds): (please press any key to continue)')
10
    /* set up delay task: 5 seconds */
11
    delay task ('please type names of as many countries as you can think of in 5 seconds, separated by
12
        spaces.. (please press any key to continue)',
                5000 /* 5000 mS */)
13
14
    /* instruction slide */
15
    /* instruction slide -- fixed duration */
16
17
    var x = instructions ('thank you for completing the delay task: test phase coming up in 5 seconds..')
    x.set expiry(5000)
18
19
    x.key_expiry = false
20
    instructions ('third delay phase (6 seconds): (please press any key to continue)')
21
22
23
    /* set up delay task: 6 seconds */
    delay task ('please type names of as many countries as you can think of in 6 seconds, separated by
24
        spaces.. (please press any key to continue)',
                6000 /* 10000 mS */)
25
26
    /* instruction slide */
27
    instructions ('all done.. thank you.. (please press any key to continue)')
28
29
  }
```

- 3.3. **experiments/feedback/my-experiment.js.** To collect user feedback in a multiple-choice format, we use the "feedback" command, which takes two parameters: 1) the text to be supplied to the user, and 2) an array of key-codes for the permitted responses.
 - E.g.,
 the array [49, 50, 51, 52, 53] represents the numeric keys 1-5
 [48, 49, 50, 51, 52, 53, 54, 55, 56, 57] represents the numeric keys 0-9
 [65, 66, 67, 68] represents the letters A, B, C, D
 - and of course, other key combinations are possible. It may be necessary to consult a reference table such as
 https://en.wikipedia.org/wiki/List_of_Unicode_characters#Basic_Latin

Please see the below file **my-experiment.js** for examples.

3.3.1. The file my-experiment.js.

```
/* recognition memory experiment set-up */
  var my_experiment = function(){
3
    /* instructions */
4
    instructions ('feedback coming up.. (please press any key to continue)')
5
6
    /* feedback "task" */
7
    feedback ('please enter your affinity with the last stimulus on a scale of 1-5',
8
9
             [49, 50, 51, 52, 53]
10
    /* instructions */
11
    instructions ('thank you... more feedback coming up.. (please press any key to continue)')
12
13
    /* more feedback "task" */
14
    feedback ('please enter your affinity with the last stimulus on a scale of 0-9',
15
16
              [49, 50, 51, 52, 53, 54, 55, 56, 57, 48]
17
    /* instructions */
18
    instructions ('thank you ... multiple choice style feedback coming up .. (please press any key to
19
        continue)')
20
    /* feedback "task" */
21
    feedback('skill testing question: 10*10 is: a) 100 b) 200 c) 1000 d) 10000',
22
              [65, 66, 67, 68])
23
24
    /* instructions */
25
    instructions ('thank you.. (please press any key to continue)')
26
27 }
```

- 3.4. **experiments/study-phase/my-experiment.js.** The study phase is the part of an experiment/survey where word/image (or other) stimuli are revealed in sequence. To implement a "study-phase", we must:
 - (1) declare a stimulus pool (e.g., line 9 of the file below)
 - (2) optionally, add a number of images to the stimulus pool (e.g., line 12 of the file below)
 - (3) optionally, add a number of words to the stimulus pool (e.g., lines 15-17 of the file below)
 - (4) make a selection of items from the stimulus pool (e.g., line 20 of the file below):
 - note that only one parameter was supplied on line 20 (the parameter "N"); it will be necessary for a "M" parameter to be included in subsequent examples, because the "M" parameter is required for the "test-phase" (more discussion re: this in the next example: i.e., "experiments/test-phase/"):
 - the parameter "N" is the number of stimuli selected to be presented during the study phase;
 - the parameter "M" is the number of additional (with respect to the corresponding study phase) stimuli selected to be presented during the test phase;

- the "M" additional stimuli are to be pseudo-randomly shuffled in with the "N" stimuli originally presented during the study phase;
- i.e., "N" is the number of stimuli to be presented for the study phase; N + M stimuli are to be presented for the test phase: "N" of which were seen before in the study phase ("deja vu"); the other "M" stimuli are presented during the test phase only.
- (5) declare the study phase:
 - note that declaring the study phase is as simple as (where "p" is a stimulus pool, previously defined in the **my-experiment.js** file):

```
study phase(p)
```

although, in line 23 of the file below, two extra parameters are added:

- an ISI (which was set to be 111 mS in the example): an (optional) duration of exposure of nothing, between exposure of stimuli, and
- a SET (stimulus expiry time) which represents an (optional) maximum duration of exposure of the stimulus. Note: if one additional parameter is included in hte "study_phase" statement, this will be interpreted as ISI. In order to declare a "study_phase" with a SET (but not an ISI), one should provide two extra parameters (after "p") where the first parameter (the ISI) is set as 0, e.g.
 study phase(p, 0, 5000)

where the parameters above represent a "study_phase" with ISI of 0 mS, and a SET of 5 seconds.

3.4.1. The file my-experiment.js.

```
1 /* recognition memory experiment set-up */
  var my experiment = function(){
3
4
    /* instructions */
    instructions ('study phase coming next: (please press any key to continue)')
5
    instructions ('please remember each word/image shown\n\n\neach word/image is displayed for up to 5
       any key to advance to the next word/image\n\n(please press any key to continue)')
7
8
    /* set up a stimulus pool */
    var p = stimulus pool()
9
10
    /* add images to stimulus pool */
11
12
    p.add image(10)
13
    /* add words to stimulus pool */
14
    p.add('floccinaucinihilipilification')
15
    p.add('supercalifragilisticexpialidocious')
16
17
    p.add('umdiddlediddlediddleumdiddlei')
18
    /* select portion of items from stimulus pool */
19
    p. select (5)
20
21
    /* set up 'study phase': show selected portions of pool */
23
    study_phase(p, /* stimulus pool */
               111 /* ISI (optional) */
24
               5000 /* SET (optional) */ )
25
26
```

3.5. **experiments/test-phase/my-experiment.js.** For the "test-phase" example, we don't introduce anything new in lines 1-16.

However, on line 19, note that the second "M" parameter is added: calling the function **p.select()** with two parameters, as in line 19, is required before implementing the "study-phase" and "test-phase" in lines 22 and 28, respectively.

Note that, to declare a "test_phase" as on line 28 below, an optional ISI parameter has been included. The ISI parameter is optional, so the simplest invocation is:

```
test phase(p)
```

Similarly to declaring a "study-phase" in the previous example, a SET parameter may also be added when declaring a "test-phase" (again, if one wishes to declare a "test_phase" without ISI, and with SET > 0, two parameters need to be included: the first being ISI, which should be 0). So, while

```
test_phase(p)
is the simplest invocation,
    test_phase(p, 111)
adds an ISI of 111 mS, and
    test_phase(p, 111, 5000)
adds a SET of 5 seconds. Of course,
    test_phase(p, 0, 5000)
would add a SET of 5 seconds, without adding ISI.
```

3.5.1. The file my-experiment.js.

```
1 /* recognition memory experiment set-up */
  var my experiment = function(){
    /* set up some instruction slides */
4
    instructions ('study phase: please remember words/images and,\n\n\t* please press any key to advance
         to the next word/image\n\n\n(please press any key to continue)')
6
    /* set up a stimulus pool */
7
8
    var p = stimulus_pool()
    /* add 10 available images to stimulus pool */
10
    p.add image(10)
11
12
    /* add words to stimulus pool */
13
    p.add('floccinaucinihilipilification')
14
    p. add (\ 'supercalifragilistic expial idocious\ ')
15
    p.add('umdiddlediddlediddleumdiddlei')
16
17
    /* selection from stimulus pool: parameters are N, M according to the requirements at https://github.
18
        com/ash linrichards on/m3m0ry/blob/master/documentation/requirements.pdf
        - "N" is the number of stimuli selected to be shown during the study phase
19
20
        - "M" is the number of additional stimuli to be shown (along with the N stimuli already shown
             during the study phase) during the test phase
        - The order that the N+M stimuli appear together in the test phase is determined by pseudo-
^{21}
            random shuffling */
    p. select (5, 5)
22
23
    /* set up 'study phase': show selected portions of pool */
24
    study phase(p, 111 /* ISI of 111 mS */)
25
26
    /* some instructions before 'test phase' */
27
    instructions ('test phase coming up:\n\n\nwhen you see an image/word, please press m or n:\n\n\n\n\t*
28
         please press m if you saw an image/word before\n\n\n\t* please press n if you did not see the
        image/word before \n\n\n\propto press any key to continue)
29
    /* set up 'test phase' (user input recorded for whole randomized pool) */
30
    test phase(p, 333 /* ISI of 333 mS */ )
31
32 }
```

- 3.6. **experiments/my-experiment/my-experiment.js.** This more-substantial example is more representative of an "actual" experiment, than the previous examples.
- 3.6.1. Study/Test Phase: Declaring Multiple Stimuli Pools. In this example, the procedure for adding stimulus to a pool is diversified by the specification of multiple stimulus pools, as in lines 8-16 for a first pool, and lines 19-27 for a second pool.

Note: the required selection from each of the two stimulus pools, happens at lines 30 and 31, respectively.

3.6.2. Study/Test Phase: Using Multiple Stimuli Pools to Declare Study and Test Phases. Whereas before when we passed a stimuli pool, when declaring a study_phase or test_phase, e.g. cf the last examples:

```
study_phase(p)
test_phase(p);
```

when combining multiple stimuli pools together, we combine the stimuli pools together in an array before passing them, e.g.:

```
var pools = [p1, p2]
study_phase(pools)
test_phase(pools)
```

cf lines 34, 37 and 60 in the file **my-experiment.js** below.

- 3.6.3. Inserting a Delay Task between Study/Test Phases. An important difference between this example, and the earlier experiments/test-phase/ example, is: note the delay task inserted between the study and test phases of line 45 of my-experiment.js below.
- 3.6.4. *Modified Instructions Slide between Study/Test Phases.* Note on lines 49-51 the modified instructions slide (fixed duration) borrowed from the **experiments/instructions/** example.

This message that displays for the fixed interval of five seconds, was added to prevent the user from over-running the testing phase, with key presses (we added this interval during testing when we noticed that frantic data entry during the "delay" task could result in keypresses that would cause hiding the instructions for the testing phase).

3.6.5. The file my-experiment.js.

```
/* recognition memory experiment set-up: customized / complex experiment */
  var my experiment = function(){
3
    /* set up some instruction slides */
4
    instructions ('study phase: please remember words/images and press any key (please press any key to
        continue)')
6
    /* set up a stimulus pool */
7
    var p1 = stimulus pool()
8
    /* add images to stimulus pool */
10
    pl.add image(10)
11
12
    /* add words to stimulus pool */
13
    pl.add('floccinaucinihilipilification')
14
    pl.add('supercalifragilisticexpialidocious')
15
    p1.add('equanimity')
16
17
18
    /* set up a stimulus pool */
    var p2 = stimulus_pool()
19
20
    /* add images to stimulus pool */
21
22
    p2.add image(10)
23
    /* add words to second stimulus pool */
24
25
    p2.add('compassion')
    p2.add('dogovarivatsya')
26
    p2.add('umdiddlediddlediddleumdiddlei')
27
```

```
28
29
    /* selection from stimulus pool (parameters are N, M) */
    p1.select(5, 5)
30
    p2.select(5, 5)
31
32
    /* need to bundle the two pools together, into an array */
33
    var two pools = [p1, p2]
34
35
    /* set up 'study phase': show selected portions of pool */
36
    study_phase(two_pools,
37
                 111, /* ISI */
38
                 4500 /* SET */ )
39
40
    /* instruction slide */
41
    instructions ('second delay phase (5 seconds): (please press any key to continue)')
42
43
44
    /* set up delay task: 5 seconds */
    delay_task('please type names of as many countries as you can think of in 5 seconds, separated by
45
        spaces.. (please press any key to continue)',
               10000 /* 5000 mS */)
46
47
    /* instruction slide -- fixed duration */
48
    var x = instructions ('thank you for completing the delay task: test phase coming up in 5 seconds..')
49
    x.set expiry(5000)
50
    x.key\_expiry = false
51
52
    /* some instructions before 'test phase' */
53
    instructions ('test phase coming up (please press any key to continue)')
54
    instructions ('when you see an image/word, please press m or n (please press any key to continue)')
55
    instructions ('please press m if you saw an image/word before (please press any key to continue)')
56
    instructions ('please press n if you did not see the image/word before (please press any key to
57
        continue)')
58
    /* set up 'test phase' (user input recorded for whole randomized pool) */
59
    test_phase(two_pools, /* stimulus pools */
60
                111, /* ISI */
61
                6000, /* SET */
62
                6, /* extra feedback (one for every 6 slides, approx.) */
63
                "How did you feel about the last stimulus? A=positive, B=negative, C=neutral, D=not sure",
64
                    /* message for extra feedback */
                [65, 66, 67, 68] /* accepted keypresses for extra feedback */)
65
66
```

4. Sample Response Data

- 4.1. **instructions.** Because the instructions example doesn't request any feedback from the user, the data appearing on the server after a run of the **experiments/instructions/** example isn't highly complex or informative. For this example, note that
 - the "task_type" field is "instructions" in each case;
 - the duration for which each message was displayed appear in the col.: "duration (mS)";
 - the form responsible for generating the data is recorded in the first col.

```
1 url, event id, task id, task type, trial id, duration (mS), start (yyyy:mm:dd:hh:mn:ss:mls), end (yyyy:mm:dd:hh:
     mn: ss:mls), isi, set, stim type, stim id, stim pool id, response
, 0\;, 1121\;, 2017:50:23:18:51:20:315\;, 2017:50:23:18:51:30:436\;,\;,\;,\;,\;,\;"\;"

```

- 4.2. **delay.** Below, an example of data rec'd due to the **experiments/delay**/ example. Noteworthy aspects of this example include:
 - ISI (please see line 3 in the CSV file below);
 - text response data (free form) rec'd as part of the delay task (please see lines 5, 9 and 14 in the file below);
 - differing values for SET on lines 9 and 14 below;
 - for line 5, SET is absent (i.e., it's zero).

```
1 url, event_id, task_id, task_type, trial_id, duration(mS), start(yyyy:mm:dd:hh:mn:ss:mls),end(yyyy:mm:dd:hh:

```

- 4.4. **study-phase.** For the study phase example response data below please note the following differences:
 - ISI on lines 4, 6, 8, and so on;
 - the "stim_type" field which takes values of "word" and "image" for various lines (each such line represents a screen where word or image data was shown);
 - for lines where the "stim_type" field takes values of "word" and "image": the "stim_id" field takes a value which is either the word stimulus displayed (in the case that "stim_type"=="word") e.g., line 5, or the file-name of the image displayed (in the case the data line represents a screen where an image was displayed) e.g., in line 7;
 - the field "stim_pool_id" which is seen to be 1 for each stimulus below (note that, in the last example, this will change).

```
1 url, event id, task id, task type, trial id, duration (mS), start (yyyy:mm:dd:hh:mn:ss:mls), end (yyyy:mm:dd:hh:
     mn: ss:mls), isi, set, stim type, stim id, stim pool id, response

4.6. **my-experiment.** This more complex example combines aspects of the previous examples. The most important news with this example: note that the "stim_pool_id" field varies between samples: e.g., note that "floccinaucinihilipilification" carries the desired stimulus pool label "1", as it should, whereas "dogovarivatsya" carries the stimulus pool label "2", as it should.

The various data lines with types including: instructions, isi, study_phase, delay, and test_phase: these follow the pattern of the previous examples.

       load img(i)
183
184
     }
185
   }
```

5.4. **memory.js.** This file loads the various dependencies in order. Without this kind of approach, JavaScript loads scripts "asynchronously" i.e., not in order, so an approach like this is required for the system to function properly, as the system does not work if the dependencies load out of order.

```
\label{eq:condition} \text{1 var js\_added} = -1, \ \text{deps} = \ [\,]
  /* j4v4scr1pt 4n4l0g 0f 1nclud3 st4t3m3nt */
  function add_js(fn){
     var body = document.getElementsByTagName('body')[0], s = document.createElement('script')
5
6
     s.async = false, s.src = fn + '.js'
     /* wait until script is loaded before proceeding .. */
8
     s.onload = function(){
9
       if(++js_added < deps.length){</pre>
10
11
         add_js(deps[js_added])
12
13
     body.appendChild(s)
14
15 }
16
  /* c411 411 th3 ch1ldr3n */
^{17}
  dependencies = ['text', 'key', 'util', 'task', 'pool', 'state', 'egg-timer']
  for(var d in dependencies){
     deps.push('../../' + dependencies[d])
20
21 }
22 deps.push('my-experiment')
23 deps.push('../../main')
24 add_js(deps[0], '')
```

5.5. **pool.js.** This file develops the notion of "stimulus pool", a list of objects that might either be word-data or imagedata. Importantly, this includes pseudo-random sampling and pseudo-random shuffling of word/image stimulus data.

```
{\tt 1 \ var \ next\_pool\_id} = 0
     stimulus pool - object that has words or images added to it. Selections drawn randomly for "study
3

5.6. **state.js.** This file develops the notion of "state": a "state" represents an atomic interaction of the interactive survey (much like a "slide" in MS Powerpoint).

The notion of "state" includes logical aspects of determining whether to wait for specified input keys, before proceeding to the next "state": an experiment is represented as a sequential list of "states".

Notably, the "state" concept includes the functions to display word/image stimuli or messages, on the screen. Logic for dumping data to the server (upon reaching the terminal "state") also resides here.

```
1 /* global counter for states / AKA frames / AKA slides */
{\tt 2 \ var \ last\_state\_id} = -1
3
4 /* reference to 2d canvas graphics context */
5 function get ctx(){
   return canvas.getContext("2d") //document.getElementsByTagName("canvas")[0].getContext("2d");
6
7 }
  /* state: generic object representing trial (like a card in "hypercard") */
9
                                     0, /* max. presentation time (mS) */
10 function state (expiry ms =
                   key_expiry = true, /* force expiry by key-press (true <--> on) */
11
                                    0, /* interval btwn stimuli.. (ISI) 'blank slide' */
-1, /* image data (if any) */
                   intvl ms =

6. Source Code: Server Side

6.1. **xml-receive.py.** The folder data/ in the directory structure, relative to the installation folder: if it doesn't yet exist, the server-side python code should create it (provided that the appropriate permissions are available to do so).

```
1 #!/usr/bin/python
  ''', server-side python-CGI script to receive text data sent over
3 the internet by the client-side function util.js::xml_send()''
4 import os
5 import cgi
6 import uuid
7 import datetime
9 \# create /data folder if it does not yet exist
10 \, dat_f = os.getcwd() + '/data/'
11 if not os.path.exists(dat f):
      os.mkdir(dat_f)
13
14 \# retrieve CGI form data
15 \text{ dat} = \text{None}
      dat = str(cgi.FieldStorage().getvalue('data'))
17
18 except:
19
       pass
21 \# write the data to file in the data/ folder
23
       fn = dat_f + str(datetime.datetime.now().isoformat())
       open(fn + '_' + str(uuid.uuid4().hex) + '.txt', 'wb').write(dat)
24
```

7. Ideas For Possible Future Improvements

A short point-form list of possible improvements to the software:

- Finish drag-and drop implementation, that
 - prevents programmatic errors;
 - does not allow invalid experiments to be constructed; and
 - removes any technicality from the process of coding an experiment.
- Smarter image loading:
 - Automagically detect available images from folder, and
 - modify program to allow administrator to upload images with file names that aren't required to follow the numbered format.
- Support for mobile devices, or possibly:
 - show a warning message for un-supported devices.
- Accomplish API-level integration with "Mechanical Turk" for detailed/complex systematic/automated deployment of surveys for use in Recognition Memory experiments.
